## Inorganic Spectroscopic Methods

By Alan K. Brisdon

Oxford University Press. Paperback. Book Condition: new. BRAND NEW, Inorganic Spectroscopic Methods, Alan K. Brisdon, An understanding of spectroscopic methods is a prerequisite for students in chemistry and related disciplines from the undergraduate level onwards. Inorganic Spectroscopic Methods provides a firm introduction to common spectroscopic techniques and interpretation of spectra, and their application to inorganic-based systems. The approach taken is unashamedly aimed at the application of the techniques and interpretation of the spectra obtained. Worked examples, illustrative diagrams and references for a theoretical approach are provided throughout the book. Beginning with a introductory description of electromagnetic radiation and its interaction with matter, each subsequent chapter covers the physical basis of related spectroscopic methods (vibrational, resonance, UV-visible spectroscopy, mass spectrometry) and their applications typical in inorganic compounds. Each chapter ends with a number of set problems and short questions in the margin are given throughout the chapters to test the basic concepts. The final chapter offers an integrated approach to the identification of unknown materials - putting together the techniques discussed. This essential text for all undergraduate chemists will also benefit postgraduates in chemistry, and undergraduate and postgraduate students of biochemistry and the biomedical sciences.

*A whole new e book with a brand new standpoint. I have read through and i also am certain that i am going to planning to read again yet again later on. I found out this book from my i and dad advised this pdf to learn.*

*It is fantastic and great. It is really simplified but unexpected situations from the 50 % in the ebook. I discovered this ebook from my dad and i suggested this book to learn.*

The complexes are characterized by physicochemical and spectroscopic methods. The metal complexes formed as  $[ML_2] \cdot x H_2O$  with exception of the Cu(II) complex which is anhydrous. Spectroscopic data corroborate the adoption of a four-coordinate, tetrahedral geometry for the Mn(II), and Zn(II) complexes, and a four-coordinate, square planar geometry for the Cu(II) and Pd(II) complexes. Optical spectroscopic methods can be a solution to this problem and represent a potentially powerful alternative tool for the analysis of inorganic debris in heat exchangers and evaporators. In this work, a straightforward analytical approach based on Fourier-transform infrared (FTIR) spectroscopy is demonstrated.
