Modula-2 is a structured, procedural programming language developed between 1977 and 1985 by Niklaus Wirth at ETH Zurich. It was created as the language for the operating system (OS) and application software of the Lilith personal workstation. It was later used for programming outside the context of the Lilith. Wirth viewed Modula-2 as a successor to his earlier programming languages Pascal and Modula. The principal concepts are: The module as a compiling unit for separate compiling. *Modula-2 Programming*. Highly structured, Modula-2 allows the creation of modules, independent program parts that can isolate common program functions and be used to build libraries of programming routines. Modula-2's structure and access to system-level facilities are invaluable for systems-level programming. Designed by niklaus Wirth to be more fully functional than his earlier language, Pascal, Modula-2 is available for the IBM PC, Apple II, Macintosh, VAX, and other computers.
