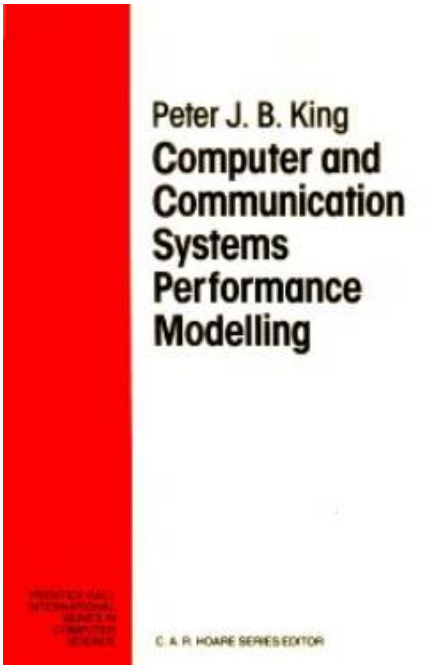
COMPUTER AND COMMUNICATION SYSTEMS PERFORMANCE MODELLING

PETER J.B.KING



SUMMARY

Computer and Communication Systems Performance Modelling provide an introduction to the field of quantitative analysis of computer and communication system performance. The book introduces some of the most powerful mathematical tools for analysing queueing systems and applies them to realistic examples.

Readers will find detailed considerations of Little's theorem and its consequences, analyses of M/M/1, M/G/1 and discrete time queues showing ail steps of analysis. There is also extensive coverage of BLMP networks and algorithms for their analysis. A unique feature is the treatment of numerical methods for queueing system solution. Each chapter has a bibliography and most contain exercises.

This text is suitable for students of Computer Science as well as practising Communications Engineers.

CONTENTS

Preface xii

1 Introduction 1
- 1.1 History 2
- 1.2 Performance measures 3
- 1.3 Notation 3
- 1.4 D/D/1 queue 5
- 1.5 Little 's theorem 6
  - 1.5.1 Proof of Little's theorem 9
- 1.6 Applications of Little 's theorem 11
  - 1.6.1 G/G/1 queue 11
  - 1.6.2 Time sharing system response time 13
- 1.7 Further reading 14
- 1.8 Bibliography 15

2 Probability theory 18
- 2.1 Axioms of probability 18
  - 2.1.1 Conditional probability 20
  - 2.1.2 Bayes theorem 21
- 2.2 Random variables 22
- 2.3 Discrete random variables 22
  - 2.3.1 Discrete distributions 24
- 2.4 Continuous random variables 26
  - 2.4.1 Continuous distributions 28
- 2.5 Generating functions and Laplace transforms 28
- 2.6 Exercises 31
- 2.7 Further reading 32
- 2.8 Bibliography 32

3 Stochastic processes 34
- 3.1 Poisson process 34
- 3.2 Random walk 36
- 3.3 Markov processes and chains 37
  - 3.3.1 Markov chains 37
  - 3.3.2 State classification 39
  - 3.3.3 Stationary distribution 39
  - 3.3.4 Markov processes 39
  - 3.3.5 Local balance and time reversibility 40
- 3.4 Renewal theory 41

3.4 Renewal theory 41
3.5 Proof of Little 's theorem 43
3.6 Further reading 46
3.7 Bibliography 46

4 Simple queues 48
4.1 M/M/1 queue 48
4.2 Steady state diagrams 52
4.3 Birth-and-death processes 52
4.4 Limited waiting room 53
4.5 Finite customer population 55
4.6 Discrete time queues 57
4.7 Exercises 60
4.8 Further reading 61
4.9 Bibliography 61

5 M/G/1 queues 62
5.1 Mean queue length 62
5.2 Embedded Markov chain 65
5.2.1 Khintchine's argument 67
5.3 Tagged jobs 67
5.4 Random observations 69
5.5 M/G/1 queues with server vacations 71
5.5.1 Disk sector queueing 73
5.6 Exercises 75
5.7 Further reading 76
5.8 Bibliography 76

6 Queues with breakdowns 78
6.1 M/M/1 queue with breakdowns 78
6.2 M/G/1 queue with breakdowns 81
6.3 Exercises 83
6.4 Further reading 83
6.5 Bibliography 84

7 Priority queues 85
7.1 Non-preemptive priority queue 85
7.2 Preemptive priority queues 87
7.3 Kleinrock's conservation law 89
7.4 Service time dependent priorities 90
7.5 Exercises 91
7.6 Further reading 92
7.7 Bibliography 92

8 Waiting time distributions of queues 94
8.1 Waiting time distribution 94
8.2 FCFS waiting time 94
8.3 Busy period analysis 95
8.4 Waiting time distributions 98
8.5 Waiting time for LCFS discipline 101
8.6 Exercises 102
8.7 Further reading 103
8.8 Bibliography 103

9 Multiple server queues 104
9.1 M/M/c queues 104
9.2 M/M/∞ queueing system 106
9.3 Slow servers 107
9.4 System with delayed second server 111
9.4.1 Numerical results 115
9.5 Muldprocessor systems with priorities 117
9.6 Exercises 122
9.7 Further reading 122
9.8 Bibliography 123
10 Networks of queues 124
10.1 Tandem queues 124
10.2 Queues with feedback 128
10.3 Jackson networks 129
10.4 Closed queueing networks 130
10.5 More general networks 132
10.6 Coxian distributions 132
10.7 Service disciplines 133
10.7.1 Processor sharing discipline 135
10.7.2 Server per job discipline 136
10.8 Local balance 136
10.9 BCMP theorem 137
10.9.1 Extensions to BCMP theorem 140
10.10 Exercises 141
10.11 Further reading 141

10.12 Bibliography 141

11 Computational algorithms for product form queueing networks 143
11.1 Convolution algorithm 143
11.2 Mean value analysis 150
11.3 LBANC 152
11.4 Multiple class networks 154
11.4.1 Convolution algorithm 154
11.4.2 MVA 155
11.4.3 LBANC 156
115 Dynamic scaling techniques 156
11.6 Tree structured convolution 158
11.7 Augmented MV A 160
11.8 RECAL 162
11.9 Mixed networks 166
11.10 Further reading 169
11.11 Bibliography 171

12 Approximations and bounds 173
12.1 Approximate MV A and Linearizer 173
12.2 Proportional approximation method 175
12.3 Priority approximations 176
12.3.1 Reduced availability approximations 177
12.3.2 Delay modification approximations 178
12.4 Flow equivalent aggregation 180
12.5 Asymptotic bound analysis 182
12.6 Balanced job bounds 183
12.7 Performance bound hierarchies 185
12.7.1 Optimistic hierarchy 186
12.7.2 Pessimistic hierarchy 186
12.8 Further reading 186
12.9 Bibliography 187

13 Numerical solution of queueing models 190
13.1 Homogenous equations 191
13.1.1 Wachter's algorithm 192
13.1.2 Plemmon's algorithm 193
13.1.3 Grassmann's algorithm 193
13.1.4 Iterative techniques 195
13.2 Eigenvector solutions 196
13.2.1 Power method 197
13.2.2 Simultaneous iteration 198
13.3 Decomposition methods 200
13.4 Matrix-geometric methods 204
13.5 Exercises 209
13.6 Further reading 209
13.7 Bibliography 210

14 Local area networks 212
14.1 Broadcast networks 213
14.1.1 ALOHA protocols 213
14.1.2 Carrier sense multiple access protocols 218
14.1.3 Carrier sense multiple access with collision detection 221
14.2 Ring networks 222
14.2.1 Token rings 224
14.2.2 Slotted rings 228
14.2.3 Register insertion rings 231
14.3 Exercises 234
14.4 Further reading 234
14.5 Bibliography 235

TOP

Computer systems design is full of conundrums: Given a choice between a single machine with speed s, or n machines each with speed s/n, which should we choose? If both the arrival rate and service rate double, will the mean response time stay the same? Should systems really aim to balance load, or is this a convenient myth? If a scheduling policy favors one set of jobs, does it necessarily hurt some other jobs, or are these "conservation laws" being misinterpreted? Do greedy, shortest-delay, routing strategies make sense in a server farm, or is what's good for the individual dis

PDF | On Jan 1, 1993, Peter G. Harrison and others published Performance Modelling of Communication Networks and Computer Architectures | Find, read and cite all the research you need on ResearchGate.Â Evaluate performance trends in Flash and storage class memories in the memory hierarchy of computer systems. From the Inside Flap. Performance of Computer Communication Systems A Model-Based Approach Boudewijn R. Haverkort Rheinisch-WestfÃ¤lische Technische Hochschule Aachen, Germany Computer communication systems and distributed systems are now able to provide an increasing range of services. As the timing requirements in the operation of these services are becoming crucial for the global community. performance assessment and selection of communication and distributed systems are, therefore, becoming more important. In this book, the author illustrates the techniques and methods used to evaluate the performance Modeling and performance evaluation of resource allocation for LTE femtocell networks. 1 Introduction. 2 LTE system overview.Â Faouzi Zarai Ph.D. is currently an Assistant Professor in Sfax High Institute of Electronics and Communication in Tunisia. His research interests are network architectures, access protocols, admission control, radio resource management, and security. Affiliations and Expertise. Assistant Professor at Sfax High Institute of Electronic and Communication, Tunisia. Petros Nicopolitidis. Petros Nicopolitidis is an Assistant Professor in the Department of Informatics at Aristotle University of Thessaloniki,located in Thessaloniki, Greece. In computing, computer performance is the amount of useful work accomplished by a computer system. Outside of specific contexts, computer performance is estimated in terms of accuracy, efficiency and speed of executing computer program instructions. When it comes to high computer performance, one or more of the following factors might be involved: Short response time for a given piece of work. High throughput (rate of processing work). Low utilization of computing resource(s).
