Heard University of South Alabama, Mobile, AL 36688. The macroinvertebrates found in the salt marshes of the northern Gulf coast are members of a unique ecosystem. Some spend their entire lives in the salt marsh, others forage there, and still others are found there only as juveniles, since the salt marsh is part of the estuarine "nursery grounds" for many fishes and invertebrates. They are found in the intertidal zone in shallow water, in the lee of sea islands, along borders of bays and inlets, and along tidal streams, bayous, and the mouths of rivers. In the United States, an almost continuous band of salt marshes fringes the Atlantic and Gulf coasts. The Gulf invertebrate database includes all invertebrate groups found in the Gulf of California except copepods and ostracods (we're still working on those!). The invertebrate database is managed by Richard C. Brusca (Arizona-Sonora Desert Museum) and Michel E. Hendrickx (Universidad Nacional Aut3noma de M3xico, Unidad Acad3mica Mazatl3n). It is updated on a regular basis, generally weekly. If you have information that could be used to update the database, we encourage you to send us an email (rbrusca@desertmuseum.org, michel@ola.icmyl.unam.mx).*
