Recognizing and nurturing giftedness in young children presents an important challenge to educators. Schools need to respond to their educational needs before their abilities diminish or become less recognizable to those who can do something about them.

Giftedness in young children refers primarily to "precocity," a rapid rate of development in one or more realms. To some people, giftedness is purely academic and means, for example, that a child earns all A's on report cards. That child may be gifted, along with the children who, at age 3, can count to 100 or read a book, or pick out a tune on the piano.

But giftedness is more than developing skills faster or going through the developmental milestones earlier. Young gifted children are intensely curious, produce a constant stream of questions, learn quickly and remember easily, and think about the world differently than their age-mates. Their intense curiosity may get them into trouble, particularly when they try to figure out how something works. They may have a super-high energy level and yet be highly sensitive and perfectionistic. Young gifted children are at risk for boredom, frustration, and depression. Recognizing giftedness is important because to persist, giftedness needs nurturing.

### Identifying Giftedness

Schools have often shied away from early intervention precisely because of the challenge of identification, and because initial assessments are often minimal estimations of a child's actual talent. The most effective way to recognize and identify giftedness is to use a variety of approaches over an extended period of time. Physical, social, and cognitive development is rapid and variable in young children. Cognitive and motor skills come suddenly: one moment the skill is not observable, then it suddenly appears. For this reason, testing may work at one time and not at another. A more complete picture of giftedness in young gifted children would involve observations of behavior and verbal ability in different classroom settings, anecdotal

information from parents, and child products (art work, diagrams, inventions, lego buildings, stories-written or told).

**Gifted behaviors.** One way to begin finding gifted children is to focus on a range of behaviors that occur in the daily conversations, activities, and responses to learning opportunities in and around the classroom. Here is a list of characteristics common in gifted four-, five-, and six-year olds:

- express curiosity about many things
- ask thoughtful questions
- have extensive vocabularies and use complex sentence structure
- are able to express themselves well
- solve problems in unique ways
- have good memories
- exhibit unusual talent in art, music, or creative dramatics
- exhibit especially original imaginations
- use previously learned things in new contexts
- are unusually able to order things in logical sequence
- discuss and elaborate on ideas
- are fast learners
- desire to work independently and take initiative
- exhibit wit and humor
- have sustained attention spans and are willing to persist on challenging tasks
- are very observant
- show talent in making up stories and telling them
- are interested in reading.

**Consulting with parents.** Since about 80% of the parent population can identify their children's giftedness by ages four or five, a short cut to finding these students is to consult with parents. They have spent hours every day with their children over a consecutive number of years, observing them closely and interacting with them in a variety of contexts. In most cases, this makes them the most realistic predictors of their children's abilities and needs. Teachers can begin to tap this resource by composing a short letter at the beginning of the year introducing themselves, describing the goals for the year, and asking specific questions about the children's strengths, learning styles, and interests. Later, they can develop a system for sharing information and insights as the year progresses.

**Portfolios.** Portfolios present another option for a talent search in the classroom. A portfolio is a collection of products (e.g., assignments, paintings, drawings, stories, observations) from school, home, or a community center. It is a repository of what a child has done or can do. Categories of achievement and ability could include any of the following: use of language; level of questioning; problem-solving strategies; depth of information; breadth of information; creativity; focus on or absorption in a task; profound interest in existential and spiritual questions; self-evaluation; preference for complexity or novelty; ability to synthesize, interpret, and imagine. Portfolios provide authentic assessment. Conducted over an extended period of time, such evidence is valuable in determining instructional plans, especially for children in kindergarten to third grade. Both parents and teachers may use portfolios to identify talent and document its development over time. General Principles for Teaching Young Gifted Children Many schools today have chosen to serve their gifted student population by enabling teachers to provide educational alternatives for them within the existing curriculum and in the regular classroom. There are a number of practical strategies teachers can employ to give young gifted students the challenge and stimulation they need without overburdening themselves with a

great deal of extra work.

**Create a learning environment.** One of the first steps to consider when meeting the needs of young gifted students is the classroom environment. The classroom needs to be a place where all children can easily engage in activities and projects at their own level and pace. Here are some suggestions for designing a child-friendly classroom:

- create a room that invites inquiry (pictures, books, areas for music, art, and a variety of materials);
- use thematic instruction to connect content areas;
- make a wide range of materials available;
- arrange for activity centers for self-initiated projects;
- have flexible seating arrangements;
- offer attractive, lesson-related activity options for students who finish work early;
- vary the atmosphere of the room through music as well as opportunities for creative movement, mime, dance, singing.

Developing learning centers can support creative learning in the classroom environment. A linguistic center, for example, could have a variety of books, dictionaries, magazines, storybook character puppets, magnetic letters with boards, crossword puzzles, alphabet games, and computer software for word processing and story writing.

**Allow for flexible grouping.** Group work is common in preschool through the primary grades. For gifted students, cluster groups, where four or five gifted children work together, provide the most productive situation for learning. Grouping young children should always enhance the strengths students have, and the kinds of groups formed (structured, open, creative, divergent, content-based, etc.) should emerge from learning goals established for each classroom activity. Here are some guidelines for organizing small groups:

- Provide variety. Offer opportunities for children to work with a variety of students grouped differently (interests, complexity level of assignments, motivation).
- Offer choices. Whenever possible, allow children to choose group mates and topics and assist in designing projects and their format.
- Create ground rules. Discuss ground rules with children. Rules for discussion may include: if you can't agree on what to do, try more than one idea; take turns sharing ideas; listen to others in your group; make your best effort; help each other; if you don't understand or agree, talk about it with your group; get the teacher's help if you need it.
- Evaluate students individually. At the conclusion of group work, it is important to evaluate them individually. Evaluations (mastery tests, portfolios, checklists, oral responses, drawings, written compositions, etc.) should focus on individual learning rather than on how students contributed to the group.
- Compact the curriculum. A proven strategy for serving young gifted children in the regular classroom is to compact—a process of compressing the essentials so that they can advance beyond the material they have already mastered. Most teachers create a system of testing and observation to determine the children's level of mastery. There are a couple of options for compacting. One is to allow gifted children to choose activities (unrelated to material covered in class) that particularly interest them. The

other is to design an activity related to the current lesson that challenges their talents. In order for this practice to work in the long run, the teacher will need to design some kind of learning contract (signed by both the child and teacher) that stipulates the activities or projects chosen, the conditions for their completion, and the outcomes. The teacher can then help them locate resources both in learning centers and the library.

- **Incorporate creative thinking.** Another way to serve young gifted children in the regular classroom is to incorporate creative thinking and activities into daily lessons—a strategy that benefits the other students as well. Young children particularly enjoy "what if" questions to stimulate new and alternative ways of exploring a subject or theme. A study of the rainforest, for example, might allow a child with an interest in lizards to become a lizard for a day. "What if you really were a chameleon living in the rainforest? What would you enjoy most about being one? Why?" Activities could include gathering new facts about that animal for the purpose of a mimed story, a self-portrait (which the child then explains afterwards), or written (or dictated) story. Teachers can support these activities by asking questions and suggesting different media and resources for their imaginative exploration.

Brainstorming with gifted children on what kinds of projects they could do may also generate ideas teachers may never have thought of on their own. The point of the brainstorming is to teach children at an early age to think of the different things they can do with the information they have learned. What would they like to do with it? What else could they find out? How would they like to express what they know? Activities could range (depending on the age and ability of the student) from map-making to naturalist studies of animal life, dramatic enactments, creative movement, art projects, and science experiments. This is where teachers' understanding of their students' unique strengths becomes vital in providing appropriate learning activities. A kindergarten class just beginning to explore numbers may be very dull to an artistically gifted child who already knows how to count to 50 and recognizes these numbers by sight. A teacher who understands the child's talent could offer encouragement to undertake an art project involving the theme of numbers (e.g., drawing objects or animals in multiples, then counting them, making designs out of numbers, exploring the relationships between numbers through art, etc.). This integration of subject areas also makes learning possible in multiple directions and allows young children to develop talents in different content areas.

### **Assessing and Documenting Development**

Like identification, assessment should be ongoing. Teachers can use tests, class assignments, observations, informal interviews, consultations with parents, and portfolios to assess how the children are doing. However, they are only meaningful if conducted repeatedly over time and within a variety of classroom activities and projects. In this way, teachers gain a more comprehensive understanding of their students' talents and can create further learning opportunities for their development.

### **Conclusion**

Early identification and intervention are essential for the growth and development of young gifted children. Equipped with practical teaching strategies and creative resources, classroom teachers are in a unique position to advance their talents in a stimulating environment of original thinking and discovery. A sensitivity to the special needs of young gifted children can make a significant difference to their future development and happiness.

involve children in shared and sustained conversation or teaching instruction that is fast paced with few if any repetition of ideas, learning steps, concepts - this is especially applicable at early years primary school level. This process is known as differentiation. Read more about differentiation below. A gifted child is more likely to be interested in the outcome of their learning experience than other children of their age. The product or end result of a learning activity can be represented in a variety of forms, a: child's contribution to a discussion. If you're an educator of gifted students, you're probably desperate for activities that will keep them engaged and excited about learning. Here you will find plenty of open-ended activities for gifted students at the elementary level, including tips about how to adapt these activities to the subjects that you teach. Writing a letter to the editor of a local paper responding to an issue in the community or in the paper itself and actually sending it. Designing an invention that will actually help people and figuring out how they might apply for a patent on it. Making their own meal plans, calculating how many calories are in various types of food, as well as which foods contain essential nutrients. Gifted kids can be a joy to teach when you know how to identify what engages them. These 50 tips and tricks are great to have in your back pocket. When I taught younger students, we would all try different systems together as our end-of-the-day procedure. 18. Use Brain Breaks. Offer gifted students a hobby that can help calm their busy minds. Allowing gifted students to have choice in the classroom allows them to feel empowered and engaged. Choices do not need to be huge either, small choices are just as important. 37. Raise the Bar.
